Assingment-1 Installation of PHP and Basic PHP Programming

Installation and Execution of First PHP Program on CentOS 7

To install PHP on CentOS 7 and execute a simple PHP program using the Apache Web Server.

Software Requirements

- Operating System: CentOS 7
- Web Server: Apache (httpd)
- PHP 8.x
- Web Browser: Firefox or Google Chrome
- Terminal

Step 1: Open Terminal

Click

Applications → Favorites → Terminal

Step 2: Install Apache Web Server

Type the following command:

sudo yum install httpd -y

Wait until the installation completes.

Step 3: Start Apache

sudo systemctl start httpd

Assingment-1 Installation of PHP and Basic PHP Programming

Step 4: Enable Apache at Boot Time

```
sudo systemctl enable httpd
```

Step 5: Check Apache Status

```
sudo systemctl status httpd
```

If Apache is running, you should see something similar to:

Active: active (running)

Press **Q** to exit the status screen.

Step 6: Install PHP

```
sudo yum install php php-cli -y
```

Step 7: Check PHP Version

```
php -v
```

Example Output:

PHP 8.2.x (cli)

Step 8: Restart Apache

```
sudo systemctl restart httpd
```

Step 9: Go to the Apache Web Directory

```
cd /var/www/html
```

Check the current directory:

```
pwd
```

Output:

```
/var/www/html
```

Assingment-1 Installation of PHP and Basic PHP Programming

Step 10: Create Your First PHP File

Create a file named **hello.php**:

```
sudo nano hello.php /vim hello.php
```

Step 11: Write the PHP Program

Type the following code:

```
<?php  
echo "<h1>Welcome to PHP Programming</h1>";  
echo "Hello Students!";  
?>
```

Step 12: Save the File

Press:

Ctrl + O

Press:

Enter

Press:

Ctrl + X

Step 13: Check Whether the File is Created

ls

Output:

hello.php

Assingment-1 Installation of PHP and Basic PHP Programming

Step 14: Restart Apache Again

```
sudo systemctl restart httpd
```

Step 15: Open Firefox or Chrome

Click

Applications

Internet

Firefox

or open **Google Chrome**.

Step 16: Type the URL

If you are working on the same computer:

```
http://localhost/hello.php
```

or

```
http://127.0.0.1/hello.php
```

If you are using another computer on the same network:

```
http://192.168.1.100/hello.php
```

Replace the IP address with your CentOS system's IP.

Find your IP address using:

```
ip addr
```

or

```
hostname -I
```

Example:

```
192.168.1.100
```
